

View of Delimara Power Station showing the new stacks on the extreme right associated with the new extension plant.

The two stacks in the centre section are associated with the Combined Cycle Gas Turbine Plant burning Gasoil.

The stack to the extreme left, standing at 150 metres, actually houses two exhaust ducts associated with the Phase 1 steam plant which burns Heavy Fuel Oil. Note the solid residue resulting from the exhaust stream , which has run down the side of the stack smudging the red/white hazard indication bands.
